LEUKOSIS REPORT

Herd Summary

NAME Holsteins **HERD NUMBER** ON **PAGE** 1 of 1 **TEST DATE** 15 Feb 07
SERVICE M10

VETERINARIAN
 Dr. Robert
 Vet Services

Interpretation of individual animal results should be made in consultation with the herd veterinarian, taking into account farm management practices and herd history for Leukosis disease. As with any biological test, the ELISA test may occasionally give false negative or false positive results. CanWest DHI accepts no responsibility for any loss or damage arising from the interpretation of these results.

HERD SUMMARY

Test Date	Samples Tested	Positive Samples	% Positive Samples This Test
15 Feb 2007	299	6	2

RESULTS INTERPRETATION

ELISA Score	Explanation
>0.30	Positive High levels of Bovine Leukosis Virus (BLV) antibodies were detected. These cows are VERY LIKELY to be infected.
0.10 – 0.30	Suspect Low levels of BLV antibodies were detected. These cows may be infected or this could be due to contamination during sampling. It is recommended to retest these animals.
<0.10	Negative BLV antibodies were not detected. These cows are VERY UNLIKELY to be infected.

LEUKOSIS TEST RESULTS BY AGE
